WORKED EXAMPLE

Figure 1 is the column application plan at the base of an 8-story building, showing the loads at serviceability limit state. It is required to found this building on a pile foundation. Using the pile catalogue, carry out sufficient calculation to establish the pile layout and quantity of reinforcing steels required in the pile caps using concrete C25/30 and grade 460 steel.

Figure 1: Load Application Plan @ Base
Table 1: Pile Catalogue

<table>
<thead>
<tr>
<th>Pile Diameter (mm)</th>
<th>400</th>
<th>500</th>
<th>600</th>
<th>750</th>
</tr>
</thead>
<tbody>
<tr>
<td>Safe Working Load (kN)</td>
<td>806</td>
<td>1343</td>
<td>1668</td>
<td>2452</td>
</tr>
</tbody>
</table>

Column A1 (Typical for A5, E1 & E5)

Assuming, we want to use two piles for this column, we can determine the pile type required by dividing the loads on the column at serviceability by the number of piles required, which is 2, and then select a suitable pile type from the pile catalogue.

\[
\text{no. of piles} = \frac{\text{Loads (Unfactored)}}{2} = \frac{(904 + 465)}{2} = 684.5\text{kN}
\]

Hence, we can adopt, 2-400mm diameter piles

![Figure 2: Pile Cap (Type 1)](image)

Geometry of the Pile-Cap

- Try an overall depth, \(h=1000\text{mm}\), effective depth =900mm
- Spacing between pile = 3\(\times\)400 = 1200mm
- Overhangs from edge of piles = 150mm
- Length of pile = 1200+400/2+400/2+150+150 =1900mm
- Width of pile cap = 400+150+150 = 700mm
**Actions @ ULS**

\[ N_{ULS} = 1.35G_k + 1.5Q_k = 1.35(904) + 1.5(465) = 1917.9kN \]

self weight of pile – cap = \((1.9 \times 0.7 \times 1 \times 25) = 33.25kN\)

\[ N = 1917.9 + 33.25 = 1951kN \]

**Tension Reinforcement**

\[ T = \frac{Nl}{2d} = \frac{1951 \times \left(\frac{1200}{2}\right)}{2 \times 900} = 650.33kN \]

\[ A_s = \frac{T}{0.87f_{yk}} = \frac{650.33 \times 10^3}{0.87 \times 460} = 1625.01\text{mm}^2 \]

The total area of reinforcement required in both direction \(A_{s,req} = 2 \times 1625.01 = 3250.02\text{mm}^2\)

*Try 18T16mm@100mm c/c Bars (As,prov =3618mm^2)*

**Verify Area of Steel**

\[ A_{s,\text{min}} = 0.26 \frac{f_{ctm}}{f_{yk}} bd \geq 0.0013bd \]

\[ f_{ctm} = 0.30f_{ck}^{\frac{2}{3}} = 0.3 \times 25^{\frac{2}{3}} = 2.56\text{Mpa} \]

\[ A_{s,\text{min}} = 0.26 \times \frac{2.56}{460} \times 1900 \times 900 \geq 0.0013 \times 1900 \times 900 \]

\[ = 2474.5\text{mm}^2 < (A_{s,\text{prov}} = 3618\text{mm}^2) \]

**Shear Verification**

Shear force per pile \(V = \frac{1951}{2} = 976kN\)

Distance to shear plane \(a_v = \frac{1900}{2} - \frac{400}{2} - (150 + 400) + \frac{400}{5} = 280\text{mm}\)
\[ V_{Ed} = \frac{V}{2d} = \frac{976 \times 280}{2 \times 900} = 151.8kN \]

\[ V_{Rd,c} = \left( \frac{0.18}{\gamma_c} \right) k(100\rho_1 f_{ck})^{\frac{1}{3}} b_w d \geq 0.035 k^{\frac{3}{2}} f_{ck} b_w d \]

\[ k = 1 + \sqrt{\frac{200}{900}} = 1 + \sqrt{\frac{200}{900}} = 1.47 < 2 \]

\[ A_s = 3618mm^2 \]
\[ b = 1900mm \]
\[ \rho_1 = \frac{A_s}{b_w d} = \frac{3618}{1900 \times 900} = 0.0021 \]

\[ V_{Rd,c} = \left( \frac{0.18}{1.5} \right) \times 1.47 \times (100 \times 0.0021 \times 25)^{\frac{1}{3}} \times 900 \times 1900 \]

\[ \geq 0.035 \times 1.242 \times \sqrt{30} \times 900 \times 1900 = 524.3kN \]

Since \( V_{Ed} < V_{Rd,c} \) (151.8kN < 524.3kN) therefore shear reinforcement is not required.

**Punching Verification**

Pile spacing has being deliberately chosen at exactly 3 times the pile diameter to avoid further punching checks except at the column face.

At the column face:

\[ N_{Ed} \leq V_{Rd,\text{max}} \]

\[ V_{Rd,\text{max}} = 0.2 \left( 1 - \frac{f_{ck}}{250} \right) f_{ck} p d = 0.2 \left( 1 - \frac{25}{250} \right) 25 \times (4 \times 400) \times 900 = 6480kN \]

\( (N_{Ed} = 1951kN) < (V_{Rd,\text{max}} = 6480kN) \) o.k.

**Column B1 (Typical for C1, D1, A2, E2, B3, C3 &D3)**

Let’s use three piles for this column, we can determine the pile type required by dividing the loads on the column at serviceability by the number of piles required, which is 3, and then select a suitable pile type from the pile catalogue.
no. of piles = \( \frac{\text{Loads (Unfactored)}}{3} = \frac{(1789 + 889)}{3} = 892.66 \text{kN} \)

Hence, we can adopt, 3-500mm diameter piles

**Geometry of the Pile-Cap**

- Try an overall depth, \( h = 1000 \text{mm} \), effective depth = 900mm
- Spacing between pile = \( 3 \times 500 = 1500 \text{mm} \)
- Overhangs from edge of piles = 150mm
- Length of pile = 1500+500/2+500/2+150+150 = 2300mm
- Width of pile cap = 500+150+150 = 800mm

**Actions @ ULS**

\[ N_{ULS} = 1.35G_k + 1.5Q_k = 1.35(1789) + 1.5(889) = 3748.65 \text{kN} \]

\[ \text{self weight of pile – cap} = (3.86m^2 \times 1 \times 25) = 96.5 \text{kN} \]

\[ N = 3748.65 + 96.5 = 3845.2 \text{kN} \]
**Tension Reinforcement**

\[ T = \frac{2Nl}{9d} = \frac{2 \times 3845.2 \times \left(\frac{1500}{2}\right)}{2 \times 900} = 712.07\text{kN} \]

\[ A_s = \frac{T}{0.87f_{yk}} = \frac{712.07 \times 10^3}{0.87 \times 460} = 1779.3\text{mm}^2 \]

The total area of reinforcement required in both direction \( A_{s,req} = 2 \times 1779.3 = 3558.6\text{mm}^2 \)

*Try 18T16mm@100mm c/c Bars (A_{s,prov}=3618\text{mm}^2)*

**Verify Area of Steel**

\[ A_{s,\text{min}} = 0.26 \frac{f_{ctm}}{f_{yk}} \frac{bd}{bd} \geq 0.0013bd \]

\[ f_{ctm} = 0.30f_{ck}^{2/3} = 0.3 \times 25^{2/3} = 2.56\text{Mpa} \]

\[ A_{s,\text{min}} = 0.26 \times \frac{2.56}{460} \times 2300 \times 900 \geq 0.0013 \times 1900 \times 900 \]

\[ = 2995.2\text{mm}^2 < (A_{s,prov} = 3618\text{mm}^2) \]

**Shear Verification**

Shear force per pile \( V = \frac{3845.2}{3} = 1281.7\text{kN} \)

Distance to shear plane \( a_v = \frac{2300}{2} - \frac{600}{2} - (150 + 500) + \frac{500}{5} = 300\text{mm} \)

\[ V_{Ed} = a_v \frac{V}{2d} = \frac{1281.7 \times 300}{2 \times 900} = 213.6\text{kN} \]

\[ V_{Rd,c} = \left(\frac{0.18}{Y_c}\right)k(100\rho_1f_{ck})^{1/3}bd \geq 0.035k^{2/3}\sqrt{f_{ck}bd} \]

\[ k = 1 + \sqrt{\frac{200}{900}} = 1 + \sqrt{\frac{200}{900}} = 1.47 < 2 \]

\[ A_s = 3618\text{mm}^2 \]
\[ b = 2300\text{mm} \]
\[ \rho_1 = \frac{A_s}{bd} = \frac{3618}{2300 \times 900} = 0.0017 \]
\[ V_{Rd,c} = \left( \frac{0.18}{1.5} \right) \times 1.47 \times (100 \times 0.0017 \times 25) \frac{1}{3} \times 900 \times 2300 \]
\[ \geq 0.035 \times 1.242 \times \sqrt{30} \times 900 \times 1900 = 591.5\text{kN} \]

Since \( V_{Ed} < V_{Rd,c} \) (213.6\text{kN} < 591.5\text{kN}) therefore shear reinforcement is not required.

**Punching Verification**

Pile spacing has being deliberately chosen at exactly 3 times the pile diameter to avoid further punching checks except at the column face

At the column face:

\[ N_{Ed} \leq V_{Rd,\text{max}} \]
\[ V_{Rd,\text{max}} = 0.2 \left( 1 - \frac{f_{ck}}{250} \right) f_{ck} pd = 0.2 \left( 1 - \frac{25}{250} \right) 25 \times (4 \times 600) \times 900 = 9720\text{kN} \]
\[ (N_{Ed} = 3845.2\text{kN}) < (V_{Rd,\text{max}} = 9720\text{kN}) \text{ o.k} \]

**Column B2 (Typical for C2 & D2)**

Let’s assume four piles for this column, we can determine the pile type required by dividing the loads on the column at serviceability by the number of piles required, which is 4, and then select a suitable pile type from the pile catalogue.

\[ \text{no. of piles} = \frac{\text{Loads (Unfactored)}}{4} = \frac{(3225 + 1725)}{4} = 1237.5\text{kN} \]

Hence, we can adopt, 4-500mm diameter piles

**Geometry of the Pile-Cap**

- Try an overall depth, \( h=1500\text{mm} \), effective depth =1400mm
- Spacing between pile = 3×500 = 1500mm
• Overhangs from edge of piles = 150mm
• Length of pile = 1500+500/2+500/2+150+150 = 2300mm
• Width of pile cap = 1500+500/2+500/2+150+150 = 2300mm

Figure 4: Pile-cap (Type 3)

**Actions @ ULS**

\[ N_{ULS} = 1.35G_k + 1.5Q_k = 1.35(3225) + 1.5(1725) = 6941.25kN \]

*Self weight of pile - cap = (2.3 \times 2.3 \times 1 \times 25) = 132.25kN*

\[ N = 6941.25 + 132.25 = 7073.5kN \]

**Tension Reinforcement**

\[ T = \frac{Nl}{4d} = \frac{7073.5 \times \left(\frac{1500}{2}\right)}{4 \times 1400} = 947.3kN \]

\[ A_s = \frac{T}{0.87f_{yk}} = \frac{947.3 \times 10^3}{0.87 \times 460} = 2367.1mm^2 \]
The total area of reinforcement required in both direction $A_{s,req} = 2 \times 2367.1 = 4734.2\text{mm}^2$

*Try 18T20mm@125mm c/c Bars ($A_{s,prov} = 5652\text{mm}^2$)*

**Verify Area of Steel**

$A_{s,\text{min}} = 0.26 \frac{f_{ctm}}{f_{yk}} bd \geq 0.0013bd$

$f_{ctm} = 0.30 f_{ck}^{\frac{2}{3}} = 0.3 \times 25^2 = 2.56\text{MPa}$

$A_{s,\text{min}} = 0.26 \times \frac{2.56}{460} \times 2300 \times 1400 \geq 0.0013 \times 1900 \times 1400$

$= 4659.2\text{mm}^2 < (A_{s,prov} = 5652\text{mm}^2)$

**Shear Verification**

Shear force per pile $V = \frac{7073.5}{2} = 3536.8\text{kN}$

Distance to shear plane $a_v = \frac{2300}{2} - \frac{800}{2} - (150 + 500) + \frac{500}{5} = 200\text{mm}$

$V_{Ed} = a_v \frac{V}{2d} = \frac{3536.8 \times 200}{2 \times 1400} = 252.6\text{kN}$

$V_{Rd,c} = \left( \frac{0.18}{Y_c} \right) k (100 \rho_1 f_{ck})^{\frac{1}{3}} b_w d \geq 0.035 k \sqrt[3]{f_{ck} b_w d}$

$k = 1 + \sqrt[3]{\frac{200}{1400}} = 1 + \sqrt[3]{\frac{200}{1400}} = 1.38 < 2$

$A_s = 5652\text{mm}^2$

$b = 2300\text{mm}$

$\rho_1 = \frac{A_s}{bd} = \frac{5652}{2300 \times 1400} = 0.0018$

$V_{Rd,c} = \left( \frac{0.18}{1.5} \right) \times 1.47 \times (100 \times 0.0018 \times 25)^{\frac{1}{3}} \times 2300 \times 1400$

$\geq 0.035 \times 1.24^{\frac{2}{3}} \times \sqrt[3]{30} \times 2300 \times 1400 = 791\text{kN}$
Since $V_{Ed} < V_{Rd,c}$ ($252.6kN < 937.8kN$) therefore shear reinforcement is not required.

**Punching Verification**

Pile spacing has being deliberately chosen at exactly 3 times the pile diameter to avoid further punching checks except at the column face

At the column face:

$N_{Ed} \leq V_{Rd,max}$

$V_{Rd,max} = 0.2 \left(1 - \frac{f_{ck}}{250}\right) f_{ck}pd = 0.2 \left(1 - \frac{25}{250}\right) 25 \times (4 \times 800) \times 1400 = 20,160kN$

$(N_{Ed} = 7073.5kN) < (V_{Rd,max} = 20,160kN)\ o.k$

**SUMMARY**

**Pile- Cap (Type 1)**

Main Bars: *18T16mm @100 c/c Bars*

Distribution Bars: *T16mm Bars @ 100 c/c*

Anti-Bust Steel: *T1mm Bars @200 c/c*
